

SEPA Credit Transfer (SCT) and SCT Instant Rulebook - synthetic fixture. An SCT Inst transaction is executed within ten seconds at any time of day, every day of the year, including weekends and public holidays. The maximum amount per SCT Inst transaction is defined by the scheme and may be raised by agreement between payment service providers. A standard SCT is not instant: funds are made available to the beneficiary by the next business day at the latest. Both schemes use ISO 20022 messages. The pacs.008 message carries a customer credit transfer between the originator and beneficiary banks, while pacs.002 reports the status of a previously submitted payment. A pacs.004 payment return is used to send funds back when settlement cannot complete. The BIC identifies the financial institution within the SEPA area, and the IBAN identifies the specific account of the customer being credited.
